

Media Compression: Not What It Used To Be

Coding+ _____

John G. Apostolopoulos
Streaming Media Systems Group
HP Labs

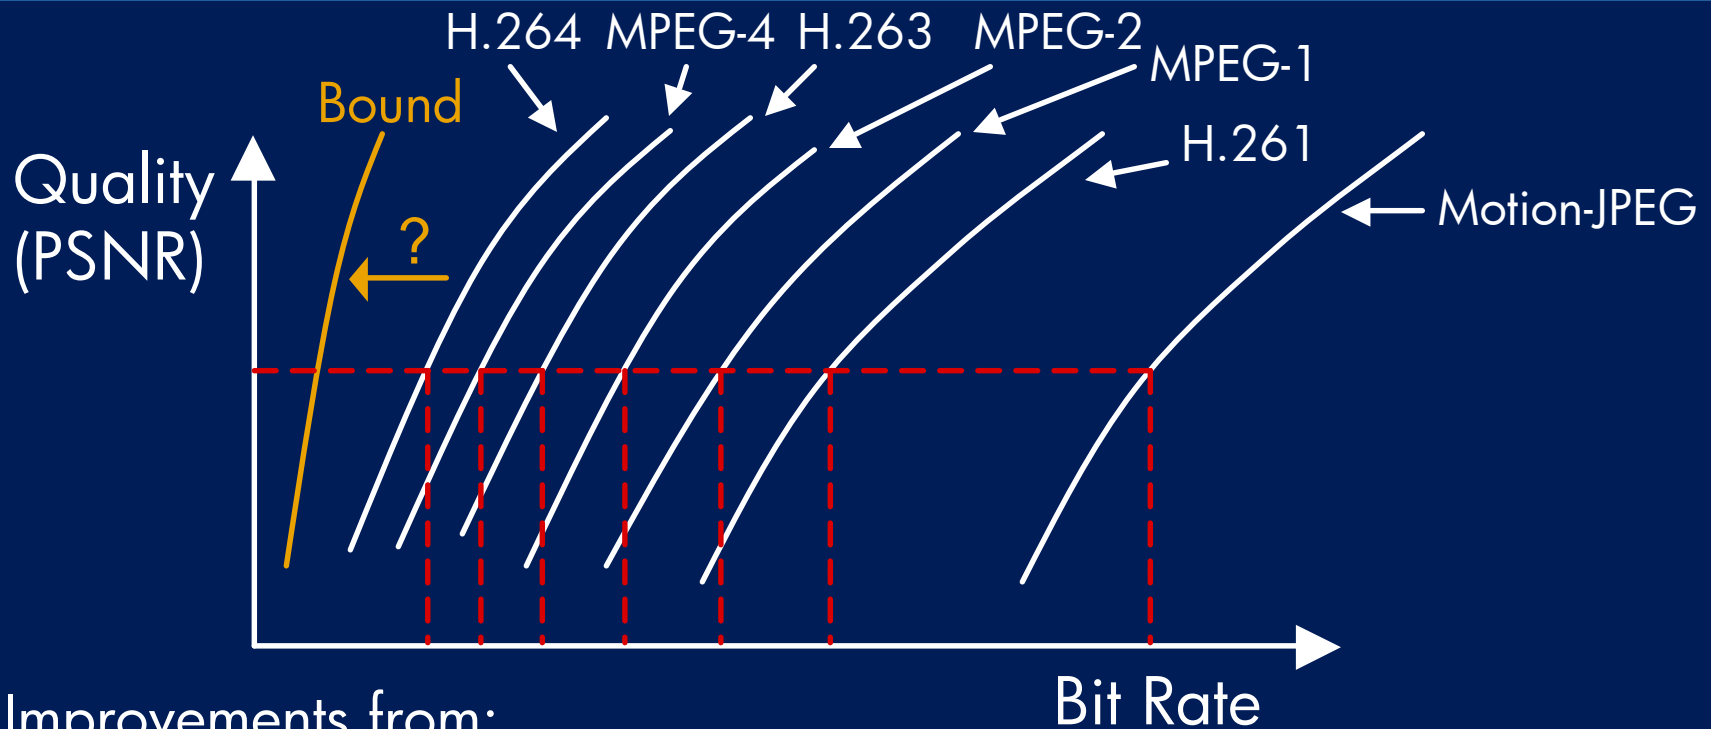

May 1, 2003

Challenges: Past, Present, and Future

- **Past:** Primarily a pure coding problem
 - Maximize quality for a given bit rate
 - Contexts: Stored media, one-to-one
- **Present: Coding+_____ (coding *plus* functionality)**
 - e.g. Media coding + networking, media coding + editing
 - Contexts: One-to-many, many-to-many, many-to-one
 - Unpredictable & time-varying bandwidths and loss rates
- **Future???**
 - Coding+_____
 - Additional media types, e.g. synthetic content
 - Distributed compression (e.g. sensor networks)

Evolution of Video Coding

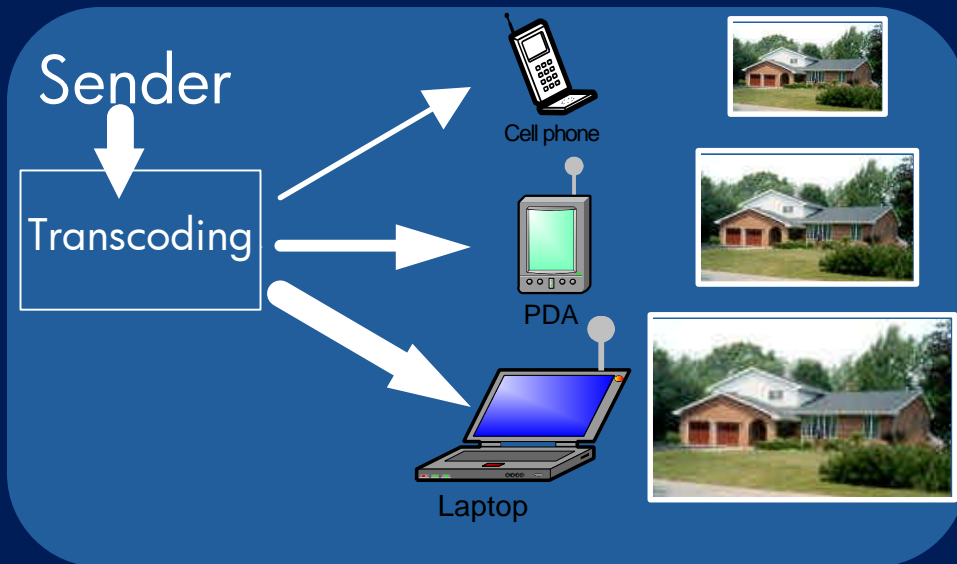

- Improvements from:
 - Getting the details right; Many enhancements & additional flexibility
 - Much more computation and memory
 - Rate-distortion optimization
- Future gains: Temporal dimension
- **What is the best we can do???**

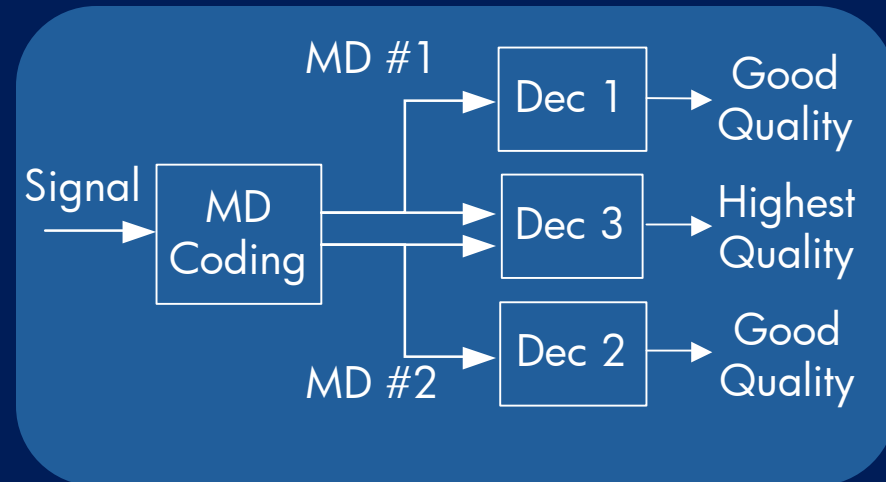

Media over Networks

- **Coding + Transcoding** for unknown or time-varying bandwidths & diverse clients

- **Coding + Robustness** for unreliable transport
e.g. Multiple Description Coding

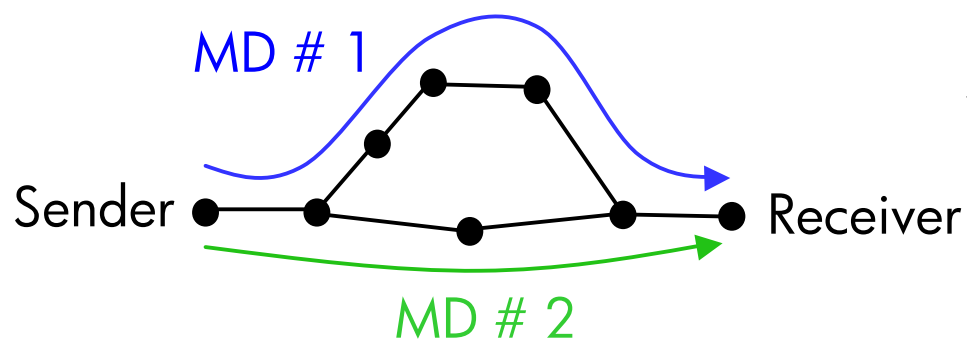

Coding + Routing

- To overcome unreliable networks:

One-to-one communication

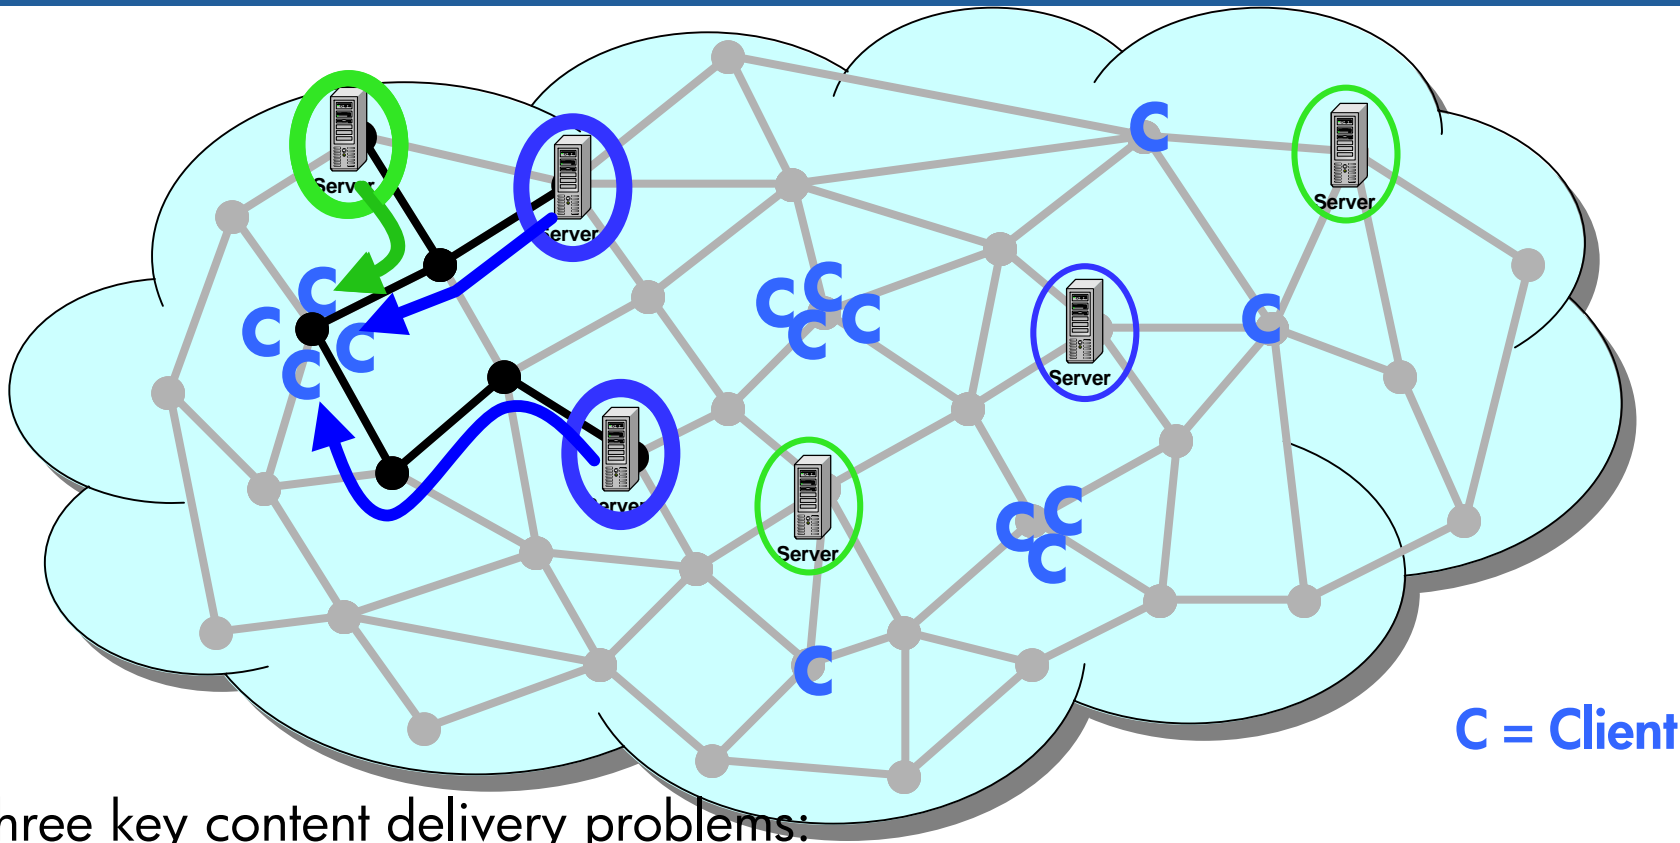

Many-to-one (e.g. MD-CDN)

- Multiple description coding plus path diversity \Rightarrow Good Match!

Coding + Content Delivery

Three key content delivery problems:

- 1) Where to deploy the servers? (Server Placement)
- 2) How to distribute the content? (Content Distribution across Servers)
- 3) How to select for each client the best server? (Server Selection)

— [Multiple Description Content Delivery Network \(MD-CDN\)](#)

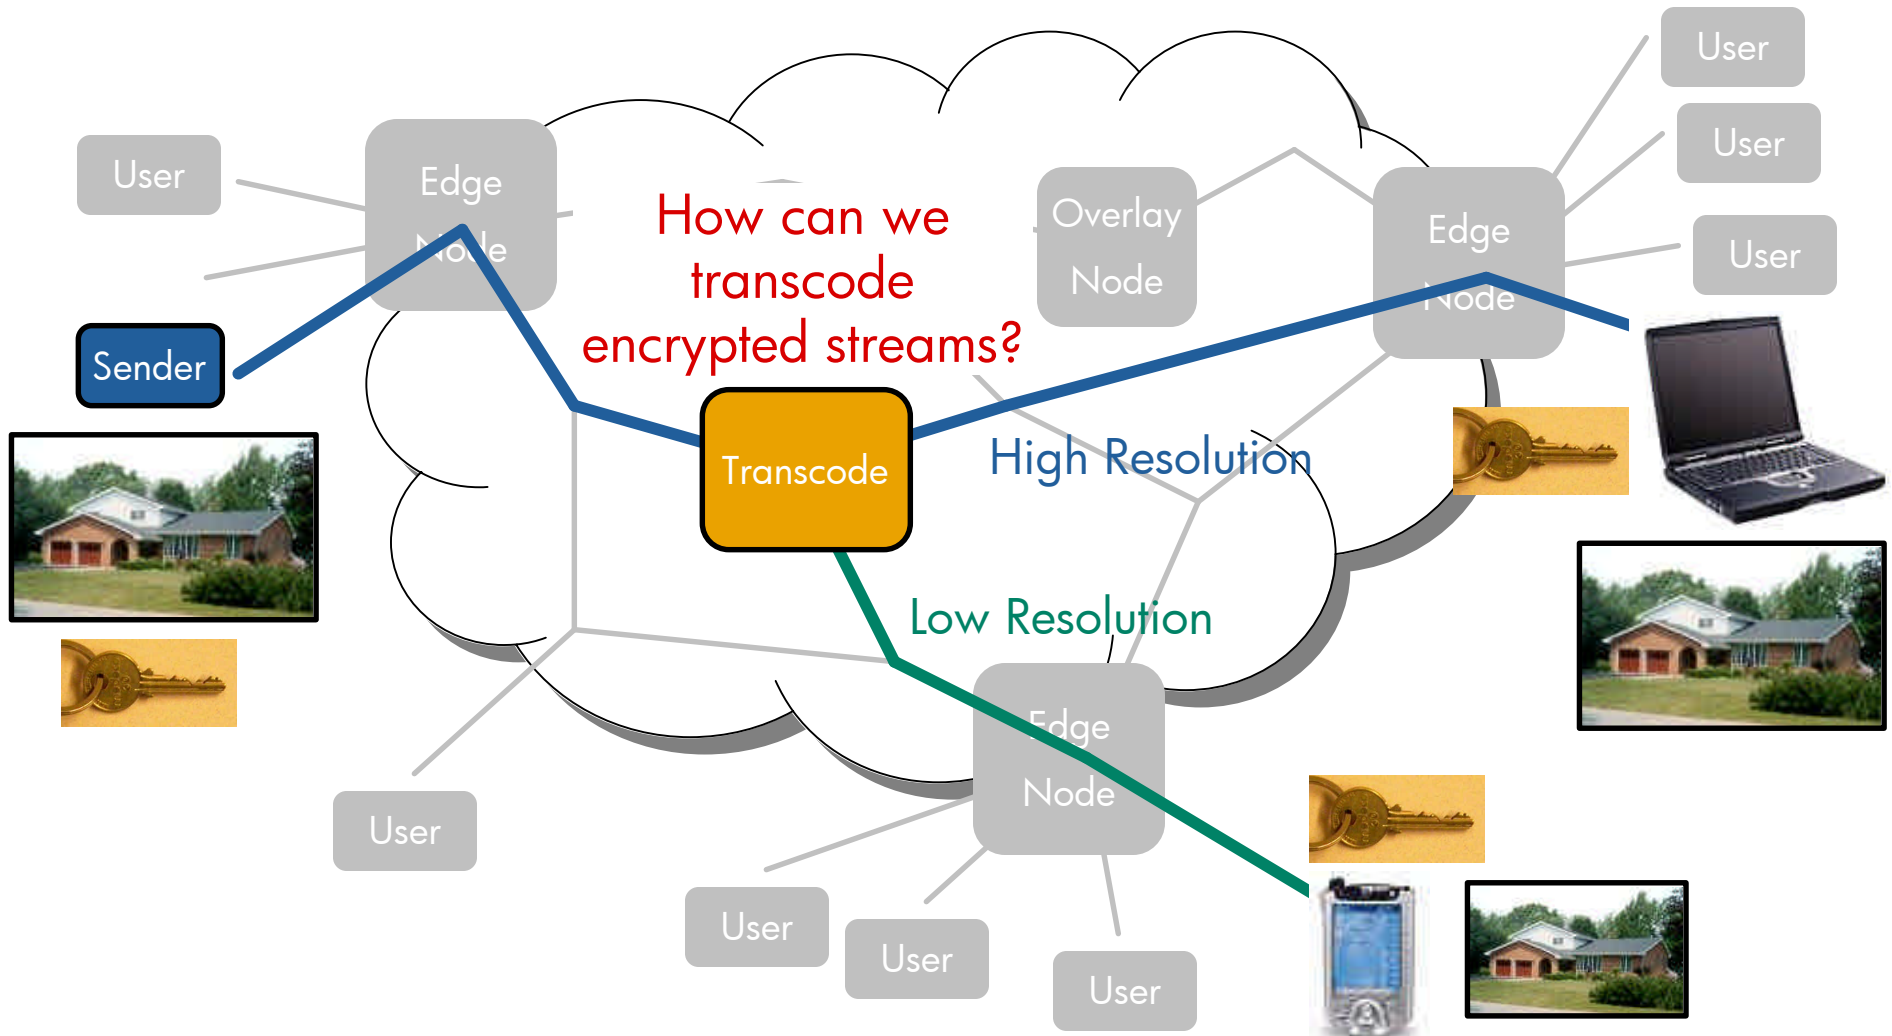

Interlayer Optimization

Example layers or modules: source coding, channel coding, networking, encryption, complexity, power

- Separate optimization:
 - Theoretically optimal in certain cases [Shannon]
 - Practically very important, basis for many real-world systems
 - Produces limitations
- Interlayer optimization
 - Potential for significant performance gains
 - Difference between **local** and **global optimum**
 - **New functionalities**

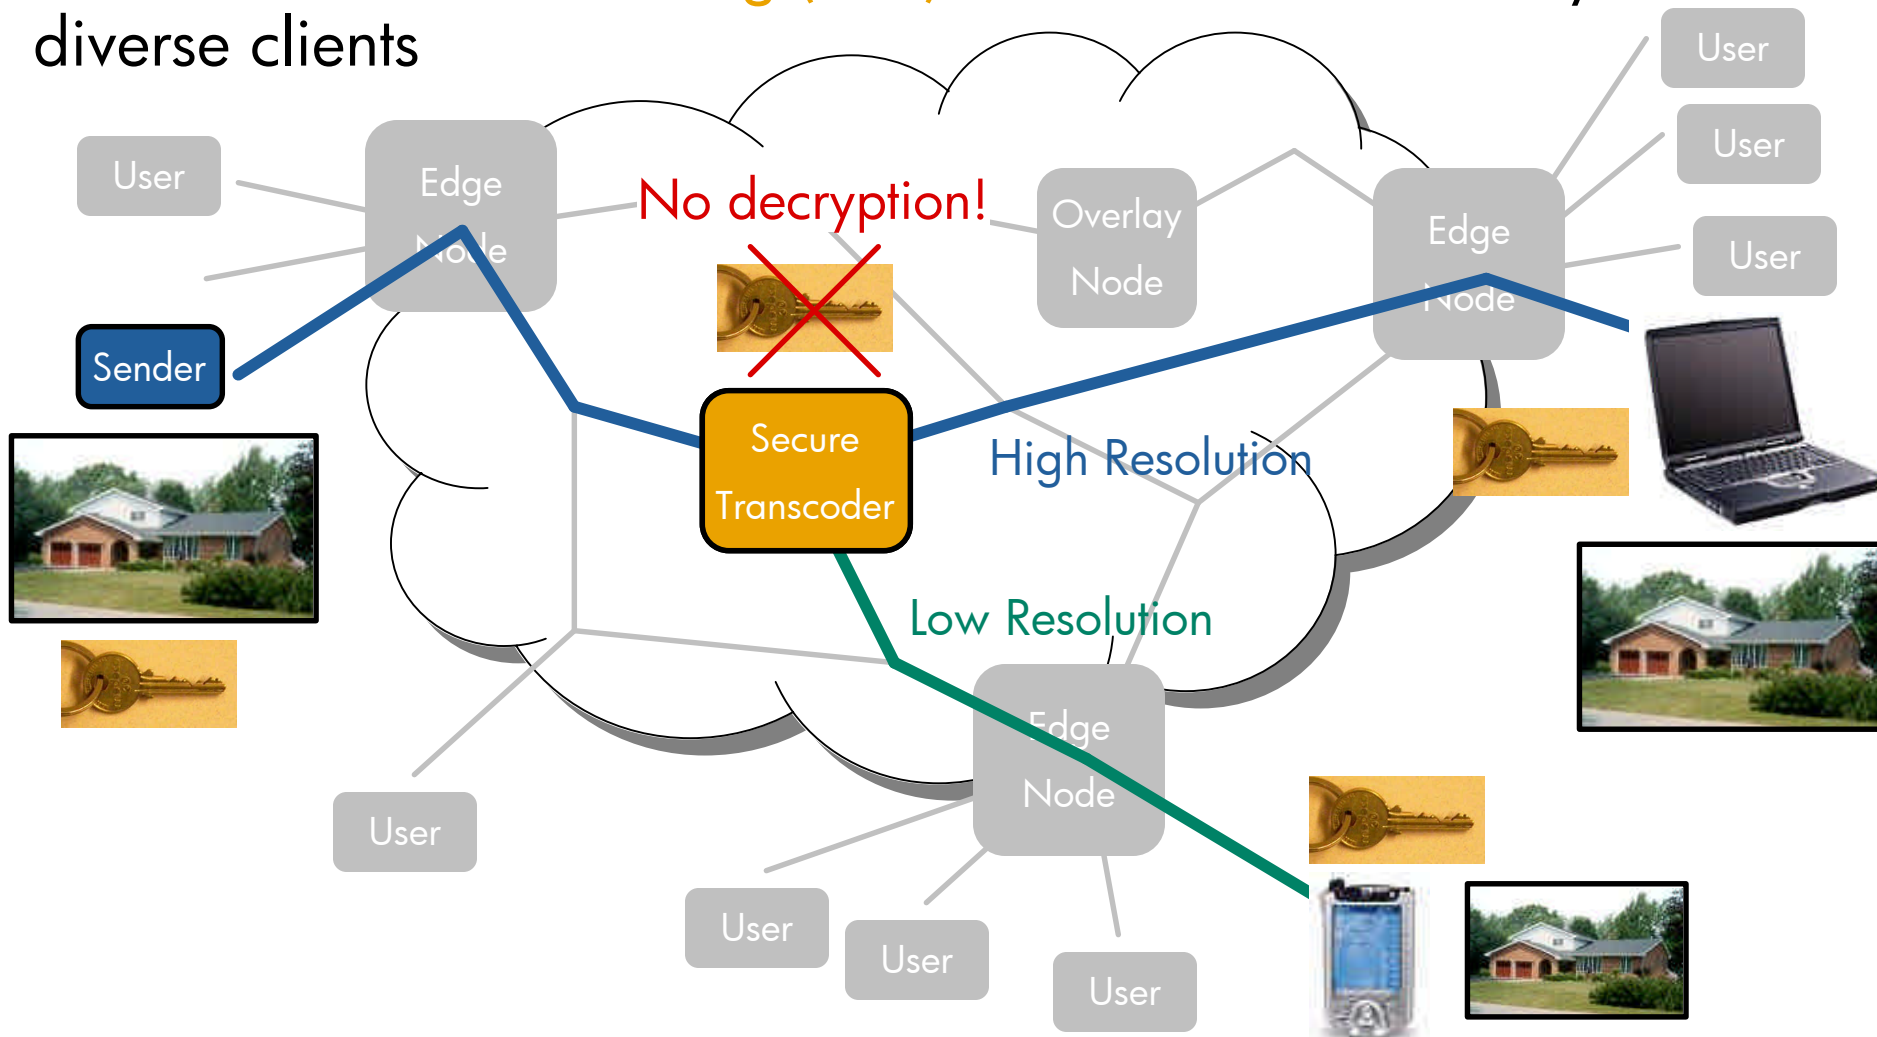

Example Problem: Transcoding for Diverse Clients and End-to-End Security

Coding + Encryption + Packetization

Secure Scalable Streaming (SSS): Secure media delivery for diverse clients

Final Thoughts

- Coding+_____ : Rich area with potential for high impact
 - Interlayer analysis, design, optimization
- Examples:
 - Coding + Transcoding
 - Coding + Robustness
 - Coding + Routing
 - Coding + Content Delivery
 - Coding + Encryption + Packetization
 - Coding + Editing
 - ...
- “Compression is not what it used to be”, **it's much more**
